

Setting

The general theme section allows you to control the behaviour and the overall appearance of your theme.

Styles

The style section contains the customizer.

Click **Customizer** to create your own style for the whole site or individual pages. You can pick colors, modify sizes and much more with a real time theme preview. Choose the style to be loaded in the layout options.

Click **Copy** and enter a new name to duplicate the style. Then you choose your new style from the list and can make adjustments.

Development

Always uncheck following options for your production website.

- ☐ Compile LESS in the browser on every page load.
- ☒ Allow styles to be loaded by URL. This will override the style originally loaded by the theme.

Compile LESS

Note Compiling LESS will replace all related CSS files. All styles will be compiled at once.

Setting	Description
Compile LESS in the browser on every page load	Check the first option and the browser automatically compiles your LESS files via JavaScript every time you load a page. This provides an appropriate testing environment. It's not recommended to enable developer mode on the live site as the constant process of compiling is highly inefficient.
Allow styles to be loaded by URL. This will override the style originally loaded by the theme.	The option enables the browser to load styles by URL. This is useful, if you want to test different styles for your website. Disable this option, when your website goes live.

To finish your LESS modifications, hit the **Compile LESS** button and all your changes will be compiled into the final CSS.

Make sure, you aren't developing in the /styles/STYLE-NAME/css folders, because these folders will be overridden as soon as you hit the **Compile LESS** button.

Maintenance mode

When you first install the theme you can to hide the front-end from visitors while you set things up for the final launch.

Logged in administrator gets full access to the site, while regular visitors will/won't be redirected to the page chosen below.

☒ Enable/disable maintenance mode.

Compression

To optimize page load time, choose one of the following compression options.

Minify CSS and JavaScript into a single file. Use gzip compression and Data URIs to reduce image file requests.

None

None

Minify

Minify + Data URIs

Minify + Data URIs + Gzip

Setting	Description
None	All files will be loaded separately and fully sized.

Combination + Minify	This option will minimize and combine CSS and JavaScript files into one single file.
Combination + Minify + Data URIs	Data URI embeds image data directly into the document, thus reducing the HTTP requests for your image files. This applies only to images that have a maximum size of 10kB.
Combination + Minify + Data URIs + Gzip	Gzip allows a faster data transfer through compressed data packages, instead of dealing with large data volumes by sending them separately

Responsive

The viewport meta tag controls the layout on mobile browsers. If it's not set, the default width on mobile is 980px and the site will look the same like on desktops.

Disable the viewport meta tag.

Posts

In this section you can configure the display of posts, if they will appear on the frontpage

Create a multi-column blog and format your posts.

4 ▼ Set the number of columns on the frontpage.

Across ▼ Order posts across or down columns.

☒ Enable navigation in post single view

Setting	Description
Set the number of columns on the frontpage	You have the ability to specify the number of posts, a maximum of 4.
Order posts across or down columns	You can determine the placement of the columns with posts: across or down
Enable navigation in post single view	Enable/disable navigation in post single view

WooCommerce

You can regulate the number of products to display per page in your shop. Also you can customize this and other elements in WooCommerce->Settings (<https://docs.woothemes.com/document/configuring-woocommerce-settings/>).

Content

Enable or disable the **To-top scroller**.

Display specific content elements in the theme.

☐ Hide To-top scroller.

Logo

Enter your logo text or use the widget in Logo sidebar.

Gem

This text will be displayed on the site only if the widget positions Logo and Logo-toolbar are empty.

Widgets

Widgets in positions can be displayed in different styles.

Choose the default widgets style for each position.

Position	Style
