If you need to install WordPress on your server then please visit: http://wordpress.org/download/. If you need any help with the installation, please refer to the guide below:

Step By Step

Here is a brief step by step on how to install WordPress:

1. Download and unzip the WordPress package if you haven't already.

2. Create a database for WordPress on your web server, as well as a MySQL user who has all privileges for accessing and modifying it.

3. Upload the WordPress files in the desired location on your web server:

   - If you want to integrate WordPress into the root of your domain (e.g. http://example.com/), move or upload all contents of the unzipped WordPress directory (but excluding the directory itself) into the root directory of your web server.

   - If you want to have your WordPress installation in its own subdirectory on your web site (e.g. http://example.com/blog/), create the blog directory on your server and upload WordPress to the directory via FTP.

Note: If your FTP client has an option to convert file names to lower case, make sure it's disabled.

4. Run the WordPress installation script by accessing wp-admin/install.php in a web browser.

   - If you installed WordPress in the root directory, you should visit: http://example.com/wp-admin/install.php

   - If you installed WordPress in its own subdirectory called blog, for example, you should visit: http://example.com/blog/wp-admin/install.php
